Présentation du titre CONCEPTEUR DEVELOPPEUR D'APPLICATIONS

Audrey Ritzenthaler

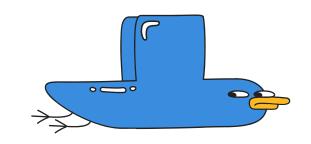

BLOOMAYS PURCHASE

SALE

On va vite pour le sourcing, on prend notre temps pour le recrutement

BLOOMAYS

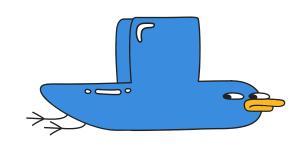

Mehdi Lebel

Loïc Calvy

CEO Bloomays

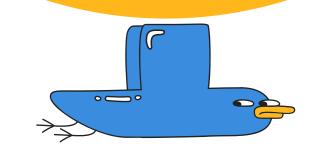

CTO Bloomays

Quoi de mieux que des techs pour recruter d'autres techs ?

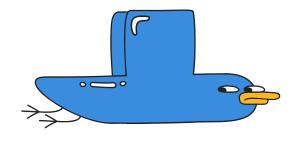

Le point technique Ma user story

- En tant que bloomer
- Je veux importer un fichier
- Afin de pouvoir stocker mes CRAs/factures

Upload ApolloServer + AWS S3

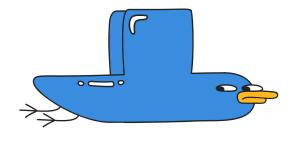

- Incompatibilité avec node 14 et +
- Type scalaire Upload
- Objet "file" reçu en argument
- CreateReadStream
- Amazon sdk

Incompatibilité avec node 14 et +

```
const { graphqlUploadExpress } = require('graphql-upload');
expressServer.use('/', graphqlUploadExpress({ maxFileSize: 50000000 }));
```

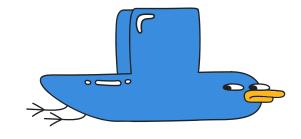

```
const apolloServer = new ApolloServer({
   schema: schemaWithResolversAndDirectives,
   context,
   uploads: false
});
```

Type scalaire Upload

```
input upload {
  activityRecordId: String!
  file: Upload!
  activityFileType: ActivityFileType!
}

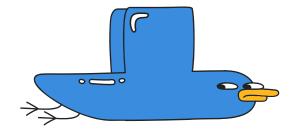

type Mutation {
  uploadActivityFile(input: upload!): Boolean @auth(requires: Bloomer)
}
```

Objet "file" reçu en argument

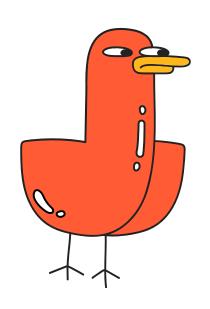

```
const { createReadStream, mimetype, filename } = await args.file;
const fileStream = createReadStream();
const path = getActivityS3Path(activity, args.activityFileType, filename);

let result;
try {
    result = await fileUpload(fileStream, mimetype, path);
} catch (errOnStorage) {
    throw new ApolloError(
        'Unable to store the uploaded file',
        'FILESTORAGE_ERROR'
    );
}
```

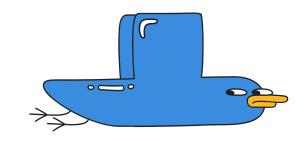

CreateReadStream

CreateReadStream() est le stream qui contient le contenu du fichier téléchargé

On rappel qu'un stream est une méthode de transfert de grandes quantités de données sur des appareils mobiles ou des sites Web en décomposant le fichier ou les données en morceaux gérables

Amazon SDK

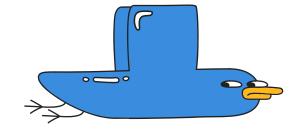

```
const aws = require('aws-sdk');

aws.config.update({
   secretAccessKey: process.env.AWS_SECRET_ACCESS_KEY,
   accessKeyId: process.env.AWS_ACCESS_KEY_ID,
   region: process.env.AWS_REGION
});

const s3 = new aws.S3();

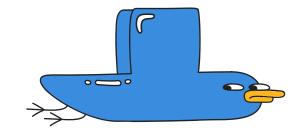

module.exports = s3;
```

```
const fileUpload = async (stream, mimetype, pathname) => {
  const params = {
    Bucket: BUCKET,
    Key: `${pathname}`,
    Body: stream,
    ContentType: mimetype
  };
  return await s3.upload(params).promise();
};
```

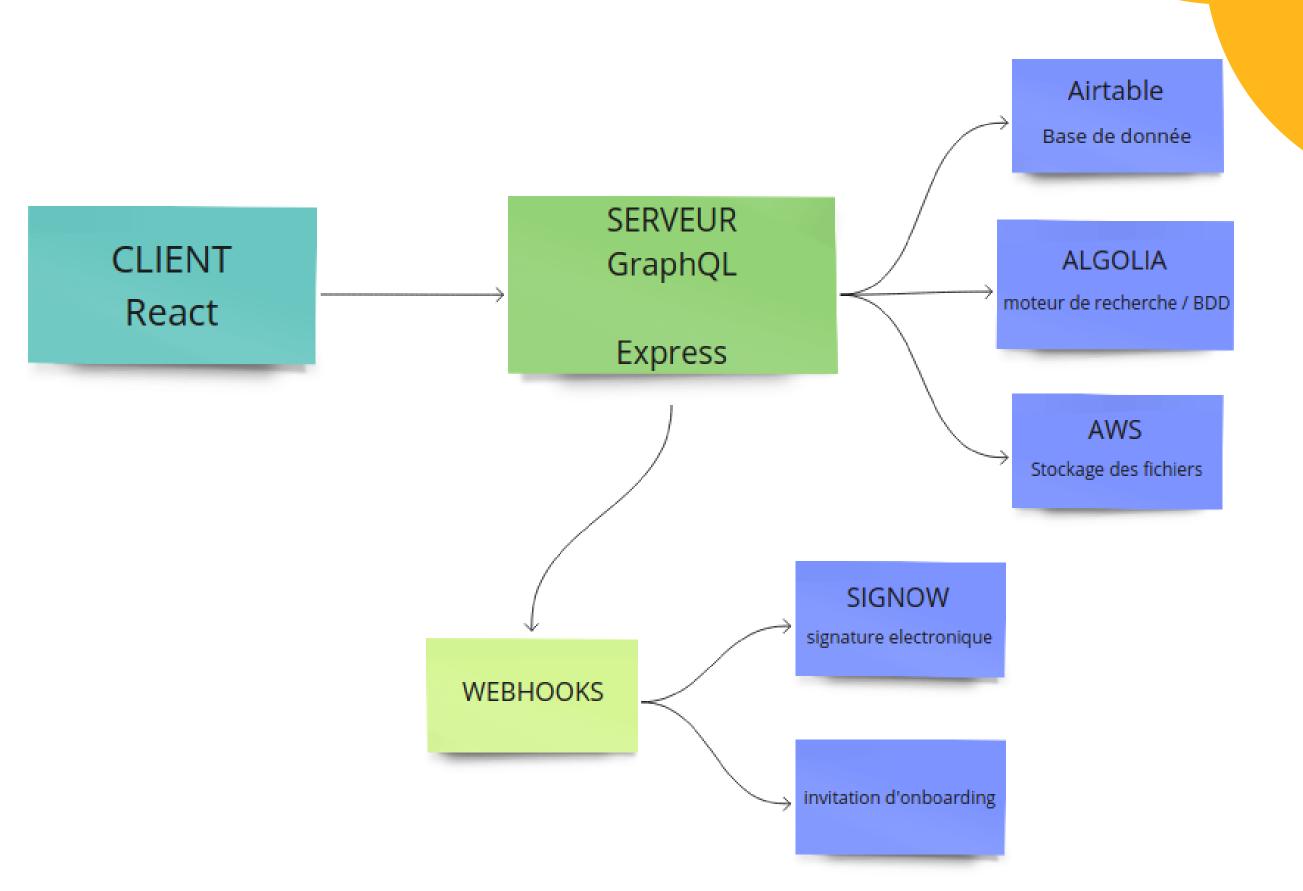

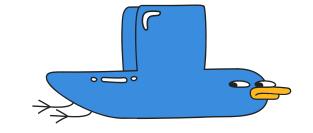

ARCHITECTURE DE L'APP
